## Be Safe in the Sun!

# Sun Safety

- The sun's ultraviolet (UV) rays can damage your skin in as little as 15 minutes.
- The following recommendations will help you protect yourself and your family.

Information presented is from CDC.gov

# Shade

- You can reduce your risk of skin damage and skin cancer by seeking shade under an umbrella, tree, or other shelter before you need relief from the sun.
- However, your best bet to protect your skin is to use sunscreen or wear protective clothing when you're outside — even when you're in the shade.

# Clothing

- When possible, long-sleeved shirts and long pants and skirts can provide protection from UV rays.
- Clothes made from tightly woven fabric offer the best protection. A wet T-shirt offers much less UV protection than a dry one, and darker colors may offer more protection than lighter colors.
- If wearing this type of clothing isn't practical, at least try to wear a T-shirt or a beach cover-up. Keep in mind that a typical T-shirt has an SPF rating lower than 15, so use other types of protection as well.

# Hats

- For the most protection, wear a hat with a brim all the way around that shades your face, ears, and the back of your neck. A tightly woven fabric, such as canvas, works best to protect your skin from UV rays. Avoid straw hats with holes that let sunlight through. A darker hat may offer more UV protection.
- If you wear a baseball cap, you should also protect your ears and the back of your neck by wearing clothing that covers those areas, using sunscreen with at least SPF 15, or by staying in the shade.

# Sunglasses

- Sunglasses protect your eyes from UV rays and reduce the risk of cataracts. They also protect the tender skin around your eyes from sun exposure.
- Sunglasses that block both UVA and UVB rays offer the best protection. Most sunglasses sold in the United States, regardless of cost, meet this standard. Wrap-around sunglasses work best because they block UV rays from sneaking in from the side.

# Sunscreen

- Put on broad spectrum sunscreen with at least SPF 15 before you go outside, even on slightly cloudy or cool days. Don't forget to put a **thick layer** on all parts of exposed skin.
- All products do not have the same ingredients; if your skin reacts badly to one product, try another one or call a doctor.
- **Reapplication** - Sunscreen wears off. Put it on again if you stay out in the sun for more than two hours and after swimming, sweating, or toweling off.
- Check the sunscreen's **expiration date**. Sunscreen without an expiration date has a shelf life of no more than **three years**, but its shelf life is **shorter if it has been exposed to high temperatures**.
- Cosmetics. Some makeup and lip balms contain some of the same chemicals used in sunscreens. If they do not have at least SPF 15, don't use them by themselves.

**Remember - Skin Cancer is no Joke!**
